

## #EE P 596: Advanced Introduction to Machine Learning

### #Project 3 Twitter Emotion Prediction

Predict the emotion of the given tweet.

###Team Kaggle Name:

###Students: Eric Chang & Naif Ganadily

###Instructor - Prof. Karthik Mohan

###TA - Ayush Singh

###Grader - Fatwir SM

Final Due Date March 15th by 11:59pm

#### Part 1

Due March 12th by 11:59pm

###Submit your solutions for parts 1, 2, 4 and 10 for this. You also need to make submissions to both the Kaggle competitions as a part of this submission. You can make updates on these submissions in the final submission as well.

## Mini-Project Overview

In this mini-project, you have a dataset of English Twitter messages and would first have to learn and make predictions about the emotion in those tweets. There are 6 emotion labels present - anger, fear, joy, love, sadness, and surprise.

The data fields in the dataset are:

1. text: a string feature.

###2. label: a classification label, with possible values including sadness (0), joy (1), love (2), anger (3), fear (4), surprise (5).

The first Kaggle competition requires you to make predictions on the labels given above.

###The second Kaggle competition has similar string and a set of possible emotions stored as a list. You can use your previous model trained for the first kaggle competition as a starting point for the second task. Zero-shot setting refers to emotions the model hasn't seen before and make predictions on it. E.g. "Morose". You would have to have the model pick from one of the input emotions amongst it.

## Submission Guidelines

- \* You get to work in teams of 2 for the Kaggle and modeling piece!! Please make sure each person of the team gets to work on all aspects of the mini-project and mention at the top of your report the contributions from each person.
- \* The submission is in 2 parts.
- \* Code: Please submit a Jupyter/IPython notebook file, report and Kaggle predictions as part of your submission. You can start with the template notebook provided and add in your solutions to it.
- \* Report: The report should be in a pdf format and have plots, correlation matrices and tables added in as mentioned in the Heart Rate Deliverables below. Feel free to use either latex or word for creating it. Include answers to conceptual questions, and your insights as well. Ideally you should NOT use comments in ipynb to answer any conceptual question.
- \* Kaggle Contest: There are a couple of Kaggle competitions, where you submit predictions on "held out" data sets.

## Dataset Description

### ##Files

- \* Local dataset can be found on Canvas.
- \* Kaggle1 Dataset - the test set
- \* sample\_submission.csv - a sample submission file in the correct format

### ##Columns of submission

\* **index** - a list from 0 to 2000, corresponding to the index in the kaggle text dataset.

\* **labels** - predicted labels for the given index rows.

## Twitter Emotion Deliverables

1. *Basics and Visualization: Load the local dataset. Briefly explain the format in which the dataset is stored. Show the number of data points for each emotion in the test data set. (20 points)*

2. *Logistic Regression: Tokenize the given sentences. You can use any library for tokenization. Then use a Logistic Regression model for prediction. (30 points)*

3. *LSTM: Use a LSTM model for the given prediction task. (40 points)*

4. *Transformer-based: Use a Transformer-based model for the task of fine-tuning on the emotions data set. Briefly explain why you chose the given architecture and how was the model pre-trained (if it was)? You can get started with Hugging Face models for this - An example notebook is already part of the lecture materials ([huggingface.co](https://huggingface.co)) (40 points)*

5. *Insights: What insights did you gain by working on this data set? What are the pros/cons of each ML model? Describe your thought process as well in the choices you made as you set up the machine learning pipeline. Also mention how you took care of over-fitting if any. (15 points)*

6. *Tabular Results: Compare the 3 models earlier in a tabular format (table) on the standard metrics for classification - f1-score, precision, recall. (5 points)*

7. *Scalability: If you had to scale your model to a million training data points, which of the models would you pick, what bottlenecks would you face and present a rough idea on how you would scale? (10 points)*

8. *Plot the curves of training, validation and test sets losses and accuracy scores with number of epochs on the x-axis for the model which gave the best metrics. Show a table in which rows are the algorithms/models used and having Precision, Recall and F1-score as metrics. (15 points)*

9. *Interpretability - Print/plot examples of tweets that were misclassified by your best model (False positives and also False negatives). Are the given labels correct? Why do you think the model might have done a mis-classification here? (10 points)*

10. *As mentioned in the overview, for the second Kaggle competition, come up with an algorithm to make predictions on it. (HINT: You might want to use word similarity models to find similar emotions to the predicted one.) Clearly describe your approach in the writeup. (40 points)*

11. *Kaggle submission (1st - 5 points + 2nd - 10 points)*

## Exercise 1

*# Loading the dataset*

```

def data_loader(file_path):

    df = pd.read_csv(file_path)

    return display(df), display(df.shape)

```

**Applying the data\_loader to all the datasets:**

```

# Using the data_loader function to show the dataset and shape
# Test Dataset 1
print('Training Dataset:')
data_loader('/content/Kaggle1_Dataset.csv')
print()
print('Training Dataset 1 & Test Dataset 1 Submission Example:')
data_loader('/content/kaggle1_sample_submission.csv')
print()

```

```

print('Test Dataset 2:')
# Using the data_loader function to show the dataset and shape
# Test Dataset 2 ?
# Based on this dataset maybe BERT or RoBERTa or EmoReact or EmoBERT?
data_loader('/content/Kaggle2_Dataset.csv')
print()
print('Training Dataset 1 & Test Dataset 2 Submission Example:')
# Using the data_loader function to show the dataset and shape
# Submission and Solutions Example
# Based on this dataset maybe BERT or RoBERTa or EmoReact or EmoBERT?
data_loader('/content/kaggle2_sample_solutions.csv')

```

## Training Dataset 1 & Test Dataset 2 Submission Example:

	index	labels
0	0	regret
1	1	regret
2	2	regret
3	3	regret
4	4	regret
...	...	...
1995	1995	regret
1996	1996	regret
1997	1997	regret
1998	1998	regret
1999	1999	regret

[2000 rows x 2 columns]

```
(2000, 2)
```

```
(None, None)
```

As we can see, the dataset has two columns: a text column and a label column. The text column contains a collection of tweets, and the label column contains integers ranging from 0 to 5, where each integer represents an emotion. sadness (0), joy (1), love (2), anger (3), fear (4), surprise (5).

```
import pandas as pd

def visualize(df):
    df = pd.read_csv(df)
    print(df.columns)
    emotions = df['label'].value_counts()
    # Counting every data point and saving it as a series

    emotions.plot(kind='bar')
    plt.title('Showcasing the Data Points for Each Emotion')
    plt.xlabel('Emotion')
    plt.ylabel('Number of Data Points')

    # Assigning each data point to its corresponding Label
    dict_labels = {0: 'Sadness', 1: 'Joy', 2: 'Love', 3: 'Anger', 4:
'Fear', 5: 'Surprise'}
    plt.xticks(emotions.index, emotions.index.map(dict_labels),
rotation=0)
    label_counts = {dict_labels[k]: v for k, v in emotions.items()}
    plt.show()

    return label_counts

df = '/content/Local_Dataset.csv'
visualize(df)

Index(['text', 'label'], dtype='object')
```

```
{'Joy': 5362,  
 'Sadness': 4666,  
 'Anger': 2159,  
 'Fear': 1937,  
 'Love': 1304,  
 'Surprise': 572}
```

```
df = pd.read_csv(df)  
df['label'].value_counts()
```

```
1    5362  
0    4666  
3    2159

1998	1998	depression
1999	1999	shock

```
[2000 rows x 2 columns]
```

### Successful Attempt 3:

Used roberta-large-mnli a much larger pretrained model and looped through the possible\_emotion row by row and picking the emotion with the highest probability score  
Succeeded with 0.364% score on Kaggle

```
from transformers import pipeline
import pandas as pd
import ast

# Loading the zero-shot classification pipeline using the mode
# roberta-large-mnli
classifier = pipeline("zero-shot-classification", model="roberta-
large-mnli")

predicted_emotions = []
for i, row in df_test.iterrows():
    text = row["text"]
    possible_emotions = ast.literal_eval(row["possible_emotions"])
    max_score = -1
    predicted_emotion = ""
    for emotion in possible_emotions:
        result = classifier(text, emotion)
        if result["scores"][0] > max_score:
            max_score = result["scores"][0]
            predicted_emotion = result["labels"][0]
    predicted_emotions.append(predicted_emotion)

# Add the predicted emotions to the test dataframe
df_test["predicted_emotions"] = predicted_emotions

# Save the results to a CSV file
df_test.to_csv('predictions7.csv', index=False)

{"model_id":"cb2ea3c101594404a4c271b68d97e70a","version_major":2,"version_minor":0}

{"model_id":"c7acfabde4c04d1594f101699a70f617","version_major":2,"version_minor":0}
```

Some weights of the model checkpoint at roberta-large-mnli were not used when initializing RobertaForSequenceClassification:

['roberta.pooler.dense.weight', 'roberta.pooler.dense.bias']

- This IS expected if you are initializing

RobertaForSequenceClassification from the checkpoint of a model trained on another task or with another architecture (e.g. initializing a BertForSequenceClassification model from a BertForPreTraining model).

- This IS NOT expected if you are initializing

RobertaForSequenceClassification from the checkpoint of a model that you expect to be exactly identical (initializing a

BertForSequenceClassification model from a BertForSequenceClassification model).

df_pred8
```

### Unsure Attempt 5:

Used GPT-2 a much larger pretrained model and looped through the possible\_emotion row by row and picking the emotion with the highest probability score. Computationally Expensive and the run time is extremely long almost 2 hours Kaggle Score: 0.0755%

```
from transformers import pipeline
```

```

# load the zero-shot classification pipeline with GPT-2 as the model
classifier = pipeline("zero-shot-classification",
model="EleutherAI/gpt-neo-2.7B")
predicted_emotions = []

```

```

for i, row in df_test.iterrows():
    text = row["text"]
    possible_emotions = ast.literal_eval(row["possible_emotions"])
    max_score = -1
    predicted_emotion = ""
    for emotion in possible_emotions:
        result = classifier(text, emotion)
        if result["scores"][0] > max_score:
            max_score = result["scores"][0]
            predicted_emotion = result["labels"][0]
    predicted_emotions.append(predicted_emotion)

# Add the predicted emotions to the test dataframe
df_test["predicted_emotions"] = predicted_emotions

# Save the results to a CSV file
df_test.to_csv('predictions9.csv', index=False)

{"model_id": "148056bf30a04e1f9df469dcccc04d9f", "version_major": 2, "version_minor": 0}

{"model_id": "0c0f6ddd13e845e3aa66988856e20655", "version_major": 2, "version_minor": 0}

```

Some weights of GPTNeoForSequenceClassification were not initialized from the model checkpoint at EleutherAI/gpt-neo-2.7B and are newly initialized: ['transformer.h.25.attn.attention.bias',

'transformer.h.21.attn.attention.bias',  
'transformer.h.19.attn.attention.bias',  
'transformer.h.15.attn.attention.bias',  
'transformer.h.9.attn.attention.bias',  
'transformer.h.13.attn.attention.bias',  
'transformer.h.27.attn.attention.bias',  
'transformer.h.3.attn.attention.bias',  
'transformer.h.17.attn.attention.bias',  
'transformer.h.7.attn.attention.bias',  
'transformer.h.1.attn.attention.bias',  
'transformer.h.29.attn.attention.bias',  
'transformer.h.31.attn.attention.bias',  
'transformer.h.5.attn.attention.bias',  
'transformer.h.23.attn.attention.bias',  
'transformer.h.11.attn.attention.bias', 'score.weight']

You should probably TRAIN this model on a down-stream task to be able to use it for predictions and inference.

```

{"model_id": "d12ae5223e0d446f94abd00adf98308f", "version_major": 2, "version_minor": 0}

{"model_id": "4f8323f938b3491b9ced83ab5595cab", "version_major": 2, "version_minor": 0}

```

```
{"model_id":"b5f21ff690354dd5aa335c9d07feb8df","version_major":2,"version_minor":0}
```

```
{"model_id":"c482f913daf9433ca0184754f2381249","version_major":2,"version_minor":0}
```

Failed to determine 'entailment' label id from the label2id mapping in the model config. Setting to -1. Define a descriptive label2id mapping in the model config to ensure correct outputs.

Using pad\_token, but it is not set yet.

Tokenizer was not supporting padding necessary for zero-shot, attempting to use `pad\_token=eos\_token`

```
df_pred9 = pd.read_csv('predictions9.csv')
df_pred9
```

macro avg	0.97	0.97	0.97	300
weighted avg	0.97	0.97	0.97	300

Training Confusion Matrix:

Accuracy = 0.9733333333333334  
Precision = 0.9708211058870552  
Recall = 0.9706675569171149  
F1 Score = 0.9703551303408777

Test

Training Classification Report:

	precision	recall	f1-score	support
anger	1.00	1.00	1.00	47
fear	0.96	1.00	0.98	50
joy	0.98	0.98	0.98	51
love	0.98	0.98	0.98	51
sadness	1.00	1.00	1.00	52
surprise	1.00	0.96	0.98	49

accuracy				0.99	300
macro avg	0.99	0.99	0.99	0.99	300
weighted avg	0.99	0.99	0.99	0.99	300

Training Confusion Matrix:

Accuracy = 0.9866666666666667  
 Precision = 0.9870537958773253  
 Recall = 0.9866613311991465  
 F1 Score = 0.9867238562091504

## Exercise 8

## Exercise 9

## Exercise 10

*# Blank space for trying things out.*
